

ABSTRACT OF THE DISCLOSURE

This device for manufacture of an electronic circuit forms a desired circuit pattern P by permeating liquid material (10, 40) including a material for circuit pattern formation into a permeable electronic substrate (100). This device for manufacture comprises an ink jet
5 type head (20, 50) which discharges liquid material (10, 40) against an electronic substrate (100), and a shifting device (70) which relatively shifts the ink jet type head (20, 50) and the electronic substrate (100) with respect to one another.
